

1. EC2 (Elastic Compute Cloud)

EC2 provides virtual servers in the AWS cloud instead of physical machines.

You can choose CPU, RAM, storage, and operating system as needed.

It is mainly used to host applications and backend services.

2. S3 (Simple Storage Service)

S3 is an object storage service used to store unlimited files and data.

It is highly durable, secure, and scalable.

Files can be accessed from anywhere using the internet.

3. VPC (Virtual Private Cloud)

VPC creates a private and isolated network inside AWS.

It allows secure communication between AWS resources.

Subnets, route tables, and security groups are configured inside

4. RDS (Relational Database Service)

RDS is a managed relational database service provided by AWS.

AWS handles database maintenance, backups, and patching.

It supports multiple database engines like MySQL and PostgreSQL.

5. Lambda

Lambda is a serverless compute service where no server management is required.

It runs code automatically when an event occurs.

Scaling and infrastructure are fully managed by AWS.

6. IAM (Identity and Access Management)

IAM is used to manage users, groups, and roles in AWS.

It controls who can access which AWS resources.

Permissions are assigned using policies.

7. CloudWatch

CloudWatch is a monitoring service for AWS resources and applications.

It collects logs, metrics, and performance data.

Alerts can be created using alarms.

8. CloudFront

CloudFront is a Content Delivery Network (CDN) service.

It caches data at edge locations closer to users.

This improves performance and reduces latency.

9. EKS (Elastic Kubernetes Service)

EKS is a managed Kubernetes service provided by AWS.

AWS manages the Kubernetes control plane automatically.

It is used to run containerized applications securely.

10. DynamoDB

DynamoDB is a fully managed NoSQL database service.

It provides fast and consistent performance at any scale.

It automatically handles scaling and availability.
